

# Choosing what to do with legacy Flash eLearning content - The five options

## Retire

If a course is no longer relevant, the learning objectives do not relate to your current learning strategy, and the content is out of date, retiring your course – or sections of your course - is the best option.

By focusing your time and energy on content that is relevant and aligned with your learning strategy you will end up with a library of courses that are useful for learners and serve your business goals.

## Record

If you do not have the source files for the course, or it was built with obsolete software, you can record the content as an MP4 video.

Recording captures the information included in the course and delivers it to learners in a globally accessible format. This works especially well for eLearning content with low-level learning objectives and little-to-no interactivity.

## Republish

If you have legacy Flash eLearning content that was developed in an older version of an authoring tool, you can republish content to a different format.

If you have access to the source files for the course, simply republish the course as HTML5 using the latest version of the authoring tool.

Quality review your course and make any quick adjustments you can to improve its effectiveness before republishing.

## Rebuild

If you have courses with relevant content, but do not have the source files, it is possible to rebuild them.

Extract as much content as you can from your legacy Flash eLearning courses, using a Flash decompiler.

Once you have all your text, audio, video, and image elements exported from your original course content, you can start to rebuild the course using the authoring tool of your choice.

## Redesign

If your course has relevant content but needs significant work to update information, improve the design, and fit with your current learning and training strategy, you may need to redesign it from scratch.

Instructional design, user interface design, graphic design and other design skills will be needed to redesign a course. If your team needs assistance with this, consider reaching out to an [eLearning agency](#).
